Example – Computation Rules for Derivatives*	Higher Order Derivatives*
$(3x^{3} + 2x - 4)' = 3 \cdot 3 \cdot x^{2} + 2 \cdot 1 - 0 = 9x^{2} + 2$ $(e^{x} \cdot x^{2})' = (e^{x})' \cdot x^{2} + e^{x} \cdot (x^{2})' = e^{x} \cdot x^{2} + e^{x} \cdot 2x$ $((3x^{2} + 1)^{2})' = 2(3x^{2} + 1) \cdot 6x$ $(\sqrt{x})' = (x^{\frac{1}{2}})' = \frac{1}{2} \cdot x^{-\frac{1}{2}} = \frac{1}{2\sqrt{x}}$ $(a^{x})' = (e^{\ln(a) \cdot x})' = e^{\ln(a) \cdot x} \cdot \ln(a) = a^{x} \ln(a)$ $(\frac{1 + x^{2}}{1 - x^{3}})' = \frac{2x \cdot (1 - x^{3}) - (1 + x^{2}) \cdot 3x^{2}}{(1 - x^{3})^{2}}$	We can compute derivatives of the derivative of a function. Thus we obtain the • second derivative $f''(x)$ of function f , • third derivative $f'''(x)$, etc., • <i>n</i> -th derivative $f^{(n)}(x)$. Other notations: • $f''(x) = \frac{d^2 f}{dx^2}(x) = \left(\frac{d}{dx}\right)^2 f(x)$ • $f^{(n)}(x) = \frac{d^n f}{dx^n}(x) = \left(\frac{d}{dx}\right)^n f(x)$

Example – Higher Order Derivatives*	Marginal Change*
The first five derivatives of function $f(x) = x^4 + 2x^2 + 5x - 3$	We can estimate the derivative $f'(x_0)$ approximately by means of the difference quotient with <i>small</i> change Δx : $f'(x_0) = \lim_{\Delta x \to 0} \frac{f(x_0 + \Delta x) - f(x_0)}{\Delta x} \approx \frac{\Delta f}{\Delta x}$
are $\begin{aligned} f'(x) &= (x^4 + 2x^2 + 5x - 3)' = 4x^3 + 4x + 5 \\ f''(x) &= (4x^3 + 4x + 5)' = 12x^2 + 4 \\ f'''(x) &= (12x^2 + 4)' = 24x \\ f^{iv}(x) &= (24x)' = 24 \\ f^{v}(x) &= 0 \end{aligned}$	$\Delta x \to 0 \qquad \Delta x \qquad \Delta x$ Vice verse we can estimate the change Δf of f for <i>small</i> changes Δx approximately by the first derivative of f : $\Delta f = f(x_0 + \Delta x) - f(x_0) \approx f'(x_0) \cdot \Delta x$ Beware: $ f'(x_0) \cdot \Delta x \text{ is a linear function in } \Delta x.$ $ It is the best possible approximation of f by a linear functionaround x_0. This approximation is useful only for "small" values of \Delta x.$

Differential*	Differential*
The approximation $\Delta f = f(x_0 + \Delta x) - f(x_0) \approx f'(x_0) \cdot \Delta x$ becomes exact if Δx (and thus Δf) becomes <i>infinitesimally small</i> . We then write dx and df instead of Δx and Δf , resp.	Differential df can be seen as a linear function in dx . We can use it to compute f approximately around x_0 . $f(x_0 + dx) \approx f(x_0) + df$
Symbols df and dx are called the differentials of function f and the independent variable x , resp.	Let $f(x) = e^x$. Differential of f at point $x_0 = 1$: $df = f'(1) dx = e^1 dx$ Approximation of $f(1.1)$ by means of this differential: $\Delta x = (x_0 + dx) - x_0 = 1.1 - 1 = 0.1$ $f(1.1) \approx f(1) + df = e + e \cdot 0.1 \approx 2.99$ Exact value: $f(1.1) = 3.004166$

Jacobian Matrix Jacobian Matrix Let $\mathbf{f} \colon \mathbb{R}^n \to \mathbb{R}^m$, $\mathbf{x} \mapsto \mathbf{y} = \mathbf{f}(\mathbf{x}) = \begin{pmatrix} f_1(x_1, \dots, x_n) \\ \vdots \\ f_m(x_1, \dots, x_n) \end{pmatrix}$ For $f: \mathbb{R}^n \to \mathbb{R}$ the Jacobian matrix is the gradient of f: $Df(\mathbf{x}_0) = \nabla f(\mathbf{x}_0)$ The $m \times n$ matrix For vector-valued functions the Jacobian matrix can be written as $D\mathbf{f}(\mathbf{x}_0) = \mathbf{f}'(\mathbf{x}_0) = \begin{pmatrix} \frac{\partial f_1}{\partial x_1} & \cdots & \frac{\partial x_n}{\partial x_n} \\ \vdots & \ddots & \vdots \\ \frac{\partial f_m}{\partial x_1} & \cdots & \frac{\partial f_m}{\partial x_n} \end{pmatrix}$ $D\mathbf{f}(\mathbf{x}_0) = \begin{pmatrix} \nabla f_1(\mathbf{x}_0) \\ \vdots \\ \nabla f_{\mathrm{er}}(\mathbf{x}_0) \end{pmatrix}$ is called the Jacobian matrix of f at point x_0 . It is the generalization of *derivatives* (and gradients) for vector-valued functions. Josef Leydold - Foundations of Mathematics - WS 2024/25 9 - Derivatives - 41 / 51 Josef Leydold - Foundations of Mathematics - WS 2024/25 9 - Derivatives - 42 / 51 Example – Jacobian Matrix **Chain Rule** Let $\mathbf{f} \colon \mathbb{R}^n \to \mathbb{R}^m$ and $\mathbf{g} \colon \mathbb{R}^m \to \mathbb{R}^k$. Then • $f(\mathbf{x}) = f(x_1, x_2) = \exp(-x_1^2 - x_2^2)$ $Df(\mathbf{x}) = \left(\frac{\partial f}{\partial x_1}, \frac{\partial f}{\partial x_2}\right) = \nabla f(\mathbf{x})$ = $\left(-2x_1 \exp(-x_1^2 - x_2^2), -2x_2 \exp(-x_1^2 - x_2^2)\right)$ $(\mathbf{g} \circ \mathbf{f})'(\mathbf{x}) = \mathbf{g}'(\mathbf{f}(\mathbf{x})) \cdot \mathbf{f}'(\mathbf{x})$ • $\mathbf{f}(\mathbf{x}) = \mathbf{f}(x_1, x_2) = \begin{pmatrix} f_1(x_1, x_2) \\ f_2(x_1, x_2) \end{pmatrix} = \begin{pmatrix} x_1^2 + x_2^2 \\ x_1^2 - x_2^2 \end{pmatrix}$ $\mathbf{f}(x,y) = \begin{pmatrix} e^x \\ e^y \end{pmatrix} \qquad \qquad \mathbf{g}(x,y) = \begin{pmatrix} x^2 + y^2 \\ x^2 - y^2 \end{pmatrix}$ $D\mathbf{f}(\mathbf{x}) = \begin{pmatrix} \frac{\partial f_1}{\partial x_1} & \frac{\partial f_1}{\partial x_2} \\ \frac{\partial f_2}{\partial x_2} & \frac{\partial f_2}{\partial x_2} \end{pmatrix} = \begin{pmatrix} 2 x_1 & 2 x_2 \\ 2 x_1 & -2 x_2 \end{pmatrix}$ $\mathbf{f}'(x,y) = \begin{pmatrix} e^x & 0\\ 0 & e^y \end{pmatrix} \qquad \mathbf{g}'(x,y) = \begin{pmatrix} 2x & 2y\\ 2x & -2y \end{pmatrix}$ $(\mathbf{g} \circ \mathbf{f})'(\mathbf{x}) = \mathbf{g}'(\mathbf{f}(\mathbf{x})) \cdot \mathbf{f}'(\mathbf{x}) = \begin{pmatrix} 2e^x & 2e^y \\ 2e^x & -2e^y \end{pmatrix} \cdot \begin{pmatrix} e^x & 0 \\ 0 & e^y \end{pmatrix}$ • $\mathbf{s}(t) = \begin{pmatrix} s_1(t) \\ s_2(t) \end{pmatrix} = \begin{pmatrix} \cos(t) \\ \sin(t) \end{pmatrix}$

9 - Derivatives - 43 / 51

9 - Derivatives - 45 / 51

Let $\mathbf{s}(t)$ be a path through \mathbf{x}_0 along \mathbf{h} , i.e.,

$$\mathbf{s} \colon \mathbb{R} \to \mathbb{R}^n, \ t \mapsto \mathbf{x}_0 + t\mathbf{h}$$

We can derive the formula for the directional derivative of $f : \mathbb{R}^n \to \mathbb{R}$

along ${\boldsymbol{h}}$ (with $\|{\boldsymbol{h}}\|=1$) at ${\boldsymbol{x}}_0$ by means of the chain rule:

 $D\mathbf{s}(t) = \begin{pmatrix} \frac{ds_1}{dt} \\ \frac{ds_2}{dt} \end{pmatrix} = \begin{pmatrix} -\sin(t) \\ \cos(t) \end{pmatrix}$

Example – Directional Derivative

Josef Leydold - Foundations of Mathematics - WS 2024/25

Then

$$f'(\mathbf{s}(0)) = f'(\mathbf{x}_0) = \nabla f(\mathbf{x}_0)$$
$$\mathbf{s}'(0) = \mathbf{h}$$

and hence

$$\frac{\partial f}{\partial \mathbf{h}} = (f \circ \mathbf{s})'(0) = f'(\mathbf{s}(0)) \cdot \mathbf{s}'(0) = \nabla f(\mathbf{x}_0) \cdot \mathbf{h} \; .$$

Josef Leydold - Foundations of Mathematics - WS 2024/25

L'Hôpital's Rule

Suppose we want to compute

$$\lim_{x \to x_0} \frac{f(x)}{g(x)}$$

and find

$$\lim_{x \to \infty} f(x) = \lim_{x \to \infty} g(x) = 0 \quad \text{(or} = \pm \infty)$$

However, expressions like $\frac{0}{0}$ or $\frac{\infty}{\infty}$ are not defined.

(You must not reduce the fraction by $0 \text{ or } \infty$!)

L'Hôpital's Rule

Josef Leydold - Foundations of Mathematics - WS 2024/25

 $= \begin{pmatrix} 2e^{2x} & 2e^{2y} \\ 2e^{2x} & -2e^{2y} \end{pmatrix}$

Josef Leydold - Foundations of Mathematics - WS 2024/25

Example – Indirect Dependency

What is the total derivative of f w.r.t. t?

Chain rule: Let $\mathbf{x} \colon \mathbb{R} \to \mathbb{R}^3$, $t \mapsto \begin{pmatrix} x_1(t) \\ x_2(t) \\ t \end{pmatrix}$

Let $f(x_1, x_2, t)$ where $x_1(t)$ and $x_2(t)$ also depend on t.

If
$$\lim_{x \to x_0} f(x) = \lim_{x \to x_0} g(x) = 0$$
 (or $= \infty$ or $= -\infty$), then

 $= f_{x_1}(\mathbf{x}(t)) \cdot x'_1(t) + f_{x_2}(\mathbf{x}(t)) \cdot x'_2(t) + f_t(\mathbf{x}(t))$

$$\lim_{x \to x_0} \frac{f(x)}{g(x)} = \lim_{x \to x_0} \frac{f(x)}{g'(x)}$$

 $\begin{aligned} \frac{df}{dt} &= (f \circ \mathbf{x})'(t) = f'(\mathbf{x}(t)) \cdot \mathbf{x}'(t) \\ &= \nabla f(\mathbf{x}(t)) \cdot \begin{pmatrix} x_1'(t) \\ x_2'(t) \\ 1 \end{pmatrix} = (f_{x_1}(\mathbf{x}(t)), f_{x_2}(\mathbf{x}(t)), f_t(\mathbf{x}(t)) \cdot \begin{pmatrix} x_1'(t) \\ x_2'(t) \\ 1 \end{pmatrix} \end{aligned}$

 $= f_{x_1}(x_1, x_2, t) \cdot x'_1(t) + f_{x_2}(x_1, x_2, t) \cdot x'_2(t) + f_t(x_1, x_2, t)$

Assumption: f and g are differentiable in x_0 .

This formula is called l'Hôpital's rule (also spelled as l'Hospital's rule).
