

Data Technologies R and HTML

R2HTML

The hard work is done by the `HTML()` generic function.

```
> HTML(ftable(Titanic, row.vars=1))

<p align= center >
<table cellspacing=0 border=1>
  <caption align=bottom class=captiondataframe>
  </caption>
  <tr><td>
    <table border=0 class=dataframe>
      <td class=cellinside> </td>
      <td class=cellinside>Sex </td>
      <td class=cellinside> Male </td>
      <td class=cellinside> </td>
    ...
```

The Sweave manual
<http://www.ci.tuwien.ac.at/~leisch/Sweave/>

Sweave

Sweave is a tool that allows you to write a document, e.g., `report.Rnw`, with embedded R code.

The function `Sweave()` runs the code chunks and replaces them with the corresponding R output. The result can be a latex document called `report.tex` or, with the R2HTML package, an HTML document called `report.html` (or with the `odfWeave` package, an ODF document).

- Analysis code and report in one file.
- Output always up to date; always corresponds to the code.
- Reproducible research.

R2HTML

The R2HTML package assists in the creation of HTML reports by generating HTML code from R objects.

```
library(R2HTML)

HTMLStart(outdir=".", filename="demoR2HTML")

ftable(Titanic, row.vars=1)

mosaicplot(~ Class + Survived, Titanic)
HTMLplot(Height=400)

HTMLStop()
```

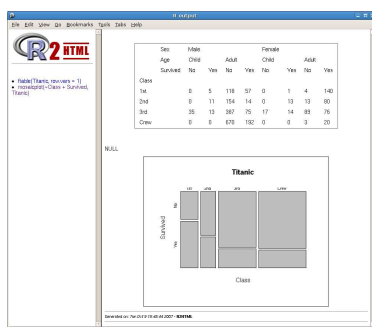

Sweave

A file called `demoSweave.Rnw`.

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional
<html>
  <head>
    <title>A Minimal HTML Document</title>
  </head>
  <body>

<<>=
summary(Titanic)

@
  </body>
</html>
```

Sweave

This is processed by typing ...

```
> Sweave("demoSweave.Rnw", driver=RweaveHTML)
```

The screenshot shows the terminal output of the Sweave command. It displays the following information:

```
A Minimal HTML Document
- summary(Titanic)
• Number of cases in table: 2201
• Number of factors: 4
• Test for independence of all factors:
ChiSq = 1637.4, df = 25, p-value = 0
Chi-squared approximation may be incorrect
```

Sweave

A file called demoSweave.html.

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional
<html>
  <head>
    <title>A Minimal HTML Document</title>
  </head>
  <link rel=stylesheet type=text/css href=R2HTML.css>
  <!-- begin{Schunk} !-->
  <!-- begin{Sinput} !-->
  <p><xmp class=command> summary(Titanic)</xmp></p>
  <!-- end{Sinput} !-->
  <br><li>Number of cases in table:<b> 2201 </b>
  <br><br><li>Number of factors:<b> 4 </b>
  <br><br><li>Test for independence of all factors:
  <br><br><p class='character'> Chisq = <b>1637.4</b>, df :
```

Sweave

- The R code can be hidden `echo=FALSE`
- If the code produces a plot, that can be automatically included `fig=TRUE`
- The result of the last expression in a code chunk is automatically formatted using `HTML()`, unless `results=html` or `results=hide`.

R2HTML and Sweave

The HTML formatting produced by R2HTML is not always very nice. If you want to just show the normal printed format from R, use the following function:

```
printVerbatim <- function(x) {
  tc <- textConnection("Rouput", "w")
  sink(tc)
  print(x)
  sink()
  close(tc)
  cat(Rouput, file=.HTML.file, sep="\n")
}
```
