Contents

Part I Preliminaries

1 Introduction 3

2 General Principles in Random Variate Generation 13
2.1 The Inversion Method 13
2.2 The Rejection Method 16
2.3 Composition 26
2.4 The Ratio-of-Uniforms Method (RoU) 32
2.5 Almost-Exact Inversion 35
2.6 Using Special Properties of the Distribution 37
2.7 Exercises 39

3 General Principles for Discrete Distributions 43
3.1 Inversion 43
3.2 The Alias Method 47
3.3 Discrete Rejection 50
3.4 Exercises 52

Part II Continuous Univariate Distributions

4 Transformed Density Rejection (TDR) 55
4.1 The Main Idea 55
4.2 The Class T_c of Transformations 59
4.3 T_c-Concave Distributions 63
4.4 Construction Points 69
4.5 Algorithms and Variants of Transformed Density Rejection . . . 88
4.6 Other Transformations 95
4.7 Generalizations of Transformed Density Rejection 97
4.8 Automatic Ratio-of-Uniforms Method 103

4.9 Exercises . . . 109

5 Strip Methods . . . 113
5.1 Staircase-Shaped Hat Functions ("Ahrens Method") . . . 114
5.2 Horizontal Strips . . . 123
5.3 Exercises . . . 124

6 Methods Based on General Inequalities . . . 125
6.1 Monotone Densities . . . 126
6.2 Lipschitz Densities . . . 134
6.3 Generators for $T_{-1/2}$-Concave Densities . . . 135
6.4 Generators for T_c-Concave Densities . . . 142
6.5 Exercises . . . 152

7 Numerical Inversion . . . 155
7.1 Search Algorithms Without Tables . . . 156
7.2 Fast Numerical Inversion . . . 158
7.3 Exercises . . . 164

8 Comparison and General Considerations . . . 165
8.1 The UNU.RAN Library . . . 166
8.2 Timing Results . . . 169
8.3 Quality of Generated Samples . . . 173
8.4 Special Applications . . . 184
8.5 Summary . . . 188

9 Distributions Where the Density Is Not Known Explicitly . 193
9.1 Known Hazard-Rate . . . 193
9.2 The Series Method . . . 201
9.3 Known Fourier Coefficients . . . 204
9.4 Known Characteristic Function . . . 206
9.5 Exercises . . . 210

Part III Discrete Univariate Distributions

10 Discrete Distributions . . . 215
10.1 Guide Table Method for Unbounded Domains . . . 216
10.2 Transformed Probability Rejection (TPR) . . . 219
10.3 Short Algorithms Based on General Inequalities . . . 227
10.4 Distributions Where the Probabilities Are Not Known Explicitly . . . 232
10.5 Computational Experience . . . 236
10.6 Summary . . . 239
10.7 Exercises . . . 241

Part IV Random Vectors

11 Multivariate Distributions . . . 245
11.1 General Principles for Generating Random Vectors . . . 246
11.2 Uniformly Distributed Random Vectors . . . 252
11.3 Multivariate Transformed Density Rejection . . . 264
11.4 Orthomonotone Densities . . . 280
11.5 Computational Experience . . . 294
11.6 Multivariate Discrete Distributions . . . 295
11.7 Exercises . . . 300

Part V Implicit Modeling

12 Combination of Generation and Modeling . . . 305
12.1 Generalizing a Sample . . . 306
12.2 Generalizing a Vector-Sample . . . 319
12.3 Modeling of Distributions with Limited Information . . . 322
12.4 Distribution with Known Moments . . . 323
12.5 Generation of Random Vectors where only Correlation and Marginal Distributions are Known . . . 328
12.6 Exercises . . . 343

13 Time Series (Authors Michael Hauser and Wolfgang Hörmann) . . . 345
13.1 Stationary Gaussian Time Series . . . 347
13.2 Non-Gaussian Time Series . . . 356
13.3 Exercises . . . 362

14 Markov Chain Monte Carlo Methods . . . 363
14.1 Markov Chain Sampling Algorithms . . . 364
14.2 Perfect Sampling for Markov Chain Monte Carlo . . . 372
14.3 Markov Chain Monte Carlo Methods for Random Vectors . . . 376
14.4 Exercises . . . 385

15 Some Simulation Examples . . . 387
15.1 Financial Simulation . . . 387
15.2 Bayesian Statistics . . . 400
15.3 Exercises . . . 409

List of Algorithms . . . 411

References . . . 415

Author index . . . 429

Selected Notation 433

Subject Index and Glossary 435
